TechProcess Solutions, provider of business solutions, has announced a major infrastructure upgrade on its online payments platform, BillJunction Payments. The new infrastructure will help boost their online payment processing capacity and has been assessed and certified as compliant to the PCI-DSS (Version 1.2.1) standard.

The upgraded platform includes features like Network Load Balancing, which will facilitate processing of higher number of concurrent transactions and virtually 100% service availability. Further, the enhanced security infrastructure ensures safe storage and encryption of card holder data during transmission, a more secure network in which online transactions are conducted, updated anti-virus software, and constantly monitored and regularly tested networks.

The internet is emerging as a mainstream revenue generation channel for business. The need of the hour for merchants, therefore, is to have payment processing platforms that offer cutting-edge processes, security and scalability," said Bikramjit Sen, CEO, TechProcess Solutions Ltd.

"It is also critical that the platforms are aligned with the best practices and industry guidelines to protect sensitive cardholder data and minimise risk of fraud for both cardholders and merchants. The PCI-DSS compliance will lead to increased controls on the TechProcess payment gateway– this will mean more comfort and greater confidence in online card transactions for the end customer, merchant and acquiring bank," said Sen.
